                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells contraining vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELGamma excluding the product encoded by exon

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudere. The tropoelastin derivatives provide contact with serum or polypeptides containing tropoelastin derivative derivatives, and other polypeptides containing tropoelastin derivative derived protease-susceptibility sites, are useful in human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents of from inducing chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or endothalial cells, fibrollasts, osteocytes, chondrootres and patelete.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptidomimetics that mimic the protease cleavage site in tropelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycoseminoglycan (6AG))-binding properties. Cells contending vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or Apbrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, epproducts. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELZ6-36 excluding exon 26A product

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative activity in the tropoelastin derivatives and other polypeptides containing tropoelastin derivative. Cerivatives, and other polypeptides containing tropoelastin derivative activity of erived protease-susceptibility sites, are useful in human or veterinary candior, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents and for inducing chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, spithelial or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that minic the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and are used for containing and ar

Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives
                                                                                                                               comprising the nucleic acids encoding the variants overlap comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELGamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical; pharmaceutical; veterinary; cosmetic application; anti-wrinkle; food; hand lotion; surgical implant; industrial product; human; SHEL; variant.

This invention relates to nucleic acid sequences AAF93744 - AAF93916

which encode human secretory or membrane proteins represented by AAB88317

- AAB88419. Included in the invention are primers AAF93917 - AAF94295 and

AAF62232 - AAF62235 which are used to isolate the CDNA sequences of the

invention. The invention also includes methods for the production of

antibodies directed against the proteins, and CDNA sequences, which can

be used in vaccines. The polynucleotide sequences can be used in gene

therapy. The polynucleotide sequences and the proteins they encode may be

used in the prevention, treatment and diagnosis of diseases associated

with inappropriate secretory protein/membrane protein expression. The

nucleic acids and complementary sequences may also be used as DNA probes

con diagnostic assays (e.g. polymerase chain reactions (FCR)) to detect

and quantitate the presence of similar nucleic acid sequences in samples.

They may also be used to study the expression and function of secretory

They may also be used as antigens in the production of antibodies

polypeptides may be used as antigens in the production of antibodies

against them and in assays to identify modulators (agonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiwrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHEL26-36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                secretory proteins/membrane proteins, useful in

antagonists) of expression and activity. The antibodies and antagonists may also be used as therapeutic agents to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid arthritis and diabetes

WPI; 2003-450961/43. N-PSDB; ADB62791. New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy

Claim 1; Page; 222pp; English.

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide of the polynucleotide by contacting the polypeptide or peptide between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide decide for detecting the polynucleotide and encoded proteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or

of gene therapy. The genes are involved in tissue and/or of the regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteopornosis, the univological diseases. Cancer, thmours. The CDNA may be used to regulate sequence presented is a protein of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the specification, but is based on sequence information supplied by the European Patent Office. or as targets for regulation of their expression and activity, 88888888888888888888

New polynucleotides and polypeptides are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.

Claim 1; SEQ ID NO 2477; 305pp; English.

The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM01316 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM01759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.

invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, encorportective, nootropic, antidiabetic, immunosuppressive, anti-HIV, gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertenaton, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                   of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Iropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical;

endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoclastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting

used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable ddG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents the synthetic human tropoelastin variant SHELGelta26A
                                                                                                                                                                                                                                                                                                                                                                              Tropoelastin, derivative, SHEL-delta-26a, SHEL, proteolysis, protease, antiwrinkle, hand lotion, bulking agent, chemotaxis, proliferation, growth inhibition, peptidomimetic, lung damage, elastin, cancer, metastasis; blood clotting.
comprising the nucleic acids encoding the variants or derivatives are
                                                                                                                                                                                                                                                                                                                                                      Amino acid sequence of a human reduced tropoelastin derivative.

The sequence is produced by removing exon 26a of SHEL (SHEL not defined). The protein is representative of tropoelastin derivatives of the invention, in which a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is conceased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in competitive inhibition of protease activity. The tropoelastin derivatives provide derivatives, and other polypeptides containing tropoelastin derivative-convertived protease-susceptibility sites, are useful in human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and

The specification describes elastin based compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities etimulating: inhibiting the proliferation of smooth muscle cells in vivo; and regulating the migration of smooth muscle cell in vivo; and may be used for the prophylaxis or treatment of a disorder characterized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           by diminished capacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                              Tropoelastin; elastin; elastic fibre; smooth muscle cell proliferation; smooth muscle cell differentiation; smooth muscle cell function; atheroscierosis; restenosis; aneurysm; vascular bypass graft stenosis; transplant arteriopathy; dissection; SVAS; hypertension; transplant arteriopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a human elastin. structures - particularly based on human elastin, useful for coating
prostheses, as wound dressings, etc., allows ingrowth of cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
This represents the human elastin sequence containing the minimal curcional unit (MTU)-1 polypeptide of the invention. This MFU-1 is a functional unit (MTU)-1 polypeptide of the invention. This MFU-1 is a functional unit (MTU)-1 polypeptide of the invention. This MFU-1 is a cont a naturally occurring fibrous protein. Each beta-sheet structure has cont a naturally occurring fibrous protein. Each beta-sheet structure has considered that can take part in crosslinking. The polypeptide at an anino acid that can take part in crosslinking. The polypeptide consolidate in the MFU polypeptides are self-aligning peptides. Spider silk protein. The MFU polypeptides are self-aligning peptides can easing the same primary structure as part of a natural fibrous protein. They are used to coat prostheses made of animal or synthetic material or compared to coat prostheses made of animal or synthetic material or control particularly for use as blood vessel or heart valve replacements. Or high-tensile streagh materials, e.g. ropes or parachute cord.

Cor high-tensile streagh materials, e.g. ropes or parachute cord.

Cor high-tensile streagh materials and are easier to manipulate and produce than full-length elastins. They are non-thrombogenic and non-immunogenic control parameterials can be made from 2 or more different MFU polypeptides to allow properties to be tailored for particular applications, e.g. combining the high extensibility of elastin and the high tensile strength of spider silk protein
```

The present sequence represents a fusion protein, comprising human clastin and c-myc, preceded by a His tag. The protein is used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth muscle cell compositions comprise at least one elastic fibre, elastins, tropoelastins compositions comprise at least one elastic fibre, elastins, tropoelastins contributing the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cells in vivo; stimulating the prophylaxis or treatment of adisorder characterized by contributed capacity to regulate smooth muscle cell function such as diminished capacity to regulate smooth muscle cell function such as atherical prophylaxis or treatment of adisorder characterized by a characterized by a characterized by an elastic streams and/or dissection. Disorders which may be treated atherically and an elastic fiscentian.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a control sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, algebyde debydrogenase 6, gravin, phospholipase C epsilon, elastin, insulin-like growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor PTK7, collagen type XVIII alpha 1, platelet derived growth factor receptor alpha, laminin M chain, subtilisin like protein PACE4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human elastin
                                                                                                                                                                                                                                               Human; endometriosis; DNA chip; fibronectin; p27; reticulocalbin; aldehyde dehydrogenase 6; gravin; phospholipase C epsilon; elastin; insulin-like growth factor binding protein-2; alpha-2 type IV collagen; transmembrane receptor PTK7; collagen type XVIII alpha 1; platelet derived growth factor receptor alpha; laminin M chain; subtilisin like protein PACE4; nidogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          In vitro diagnosis and monitoring of endometriosis, comprises detecting reduced expression of specific gene products, e.g. from the fibronectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 59; DB 5; Length 730; 100.0%; Pred. The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both samples, where a higher level protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-uprequlated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                       soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tropoelastin; derivative; proteolysis; protease; antiwrinkle; hand lotion; bulking agent; chemotaxis; proliferation; growth inhibition; peptidomimetic; lung damage; elastin; cancer; metastasis; blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a minimal functional unit (MFU) of human elastin polypeptide. This protein is useful in a cosmetic material or a prosthetic material such as prosthesis for blood vessel replacements, for heart valve replacement, tissue replacement, for covering burns, for covering wounds and stents
                                                                                                                                                                                                                                                                                                    Novel polypeptides that comprise three beta-sheet/beta-turn structures and are not naturally occurring fibrous protein, used to produce prosthesis suitable for implantation into humans, and cosmetic materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polypeptide useful in prosthesis, has a secondary structure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a human tropoelastin splice form. The specification describes tropoelastin derivatives, in which a subsequence considered so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatived proteas-susceptibility sites, are useful cropoelastin derivatived proteas-susceptibility sites, are useful cin human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand or susful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or competition, for inhibiting or controlling localized growth of cancers or competitions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·

the invention describes a polypeptide (1) comprising a minimal functioning unit (MFU) which is present in the sequence of human elastin and comprised of at least three beta-sheet/beta-turn structures, and at least cone amino acid residue that participates in cross-linking, and not a naturally occurring fibrous protein. The MFU material can be used to construct human elastin-like prostheses such as tubes for blood vessel burns or wounds to promote healing MFUs can be co-aggregated with other proteins, for e.g. collagen, to provide prosthesis material that resembles the natural structural materials of the body. MFUs modeled on lamprin and other fibrous proteins of different applications, for e.g. or ords and ropes for use in parachutes and in cosmetics. Coating synthetic prosthesis with MFUs modeled on human elastin significantly in thibits platelet binding and activation. The human-like MFU material is complibits platelet binding and activation. The human-like MFU material is considerably smaller than the composition. The MFU is considerably smaller than the composition and compliance or express in quantity, to handle in solution and to manipulate for express in thrombogenic and provides a friendly environment for cell infiltration. Enrompagenic and provides a friendly environment for cell infiltration. Enrompagenic, thus providing a truly biocompatible material. MFUs modeled on lamprin and other fibrous proteins errearies and be arriefly of material materials and providing a truly biocompatible material. MFUs materials when the environment and materials of materials errearies and materials of materials errearies and have a directly environment of main and any arriety of materials errearies and be arriefly environment. Menus providing a truly biocompatible material materials of materials errearies en beside or all materials errearies errearies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               materials having high tensile strength, elasticity and plasticity of their parent proteins. This is the amino acid sequence of mature human elastin on which the MFU peptides of the invention are based
                ď
   three beta-sheet/beta-turn structures, and is not
                                                                                                                                                                       comprising a minimal
                                                                                                                                                             invention describes a polypeptide (I)
                                 naturally occurring fibrous protein.
                                                                                                 Claim 1; Fig 1B; 21pp; English.

This invention describes a polypeptide that comprises three beta sheet/beta turn structures and that is not a naturally occurring fibrous shottly. The invention also describes a prosthesis comprising an animal, metal or synthetic material, where the surface is coated with the polypeptide, a cosmetic material, where the surface is coated with the polypeptide, a material comprising the polypeptide, a material comprising the polypeptide or a high tensile strength material comprising the polypeptide consisting essentially of a material comprising the polypeptide consisting essentially of a portion of the polypeptide consisting essentially of a portion of the mind and a lastin comprising at least three beta sheet/beta turns, conspiring at least three beta sheets/beta turns, and (d) a sheets/beta turns, (c) a polypeptide consisting essentially of a spider silk protein comprising at least three beta sheets/beta turns, a polypeptide having the primary comprising at least three beta sheets/beta turns, a polypeptide having the primary a scondary structure of a naturally of a spider silk protein and a scondary structure of a naturally of a spider silk protein and secondary structure of a portion of a naturally of a portion of a naturally of spider silk protein and secondary structure of aportion of a naturally of spider silk protein and secondary structure of an animal luni (MPU) of the invention is construct human elastin-like prostheses such as tubes for blood the spider silk protein of construct human elastin-like prostheses such as tubes for blood of the sample collagen, to provide prostheses such as wound or burn channel structural materials of the body. The MPU based material is subject to infiltration of cells growing in the parental that resembles the containing materials proposed for prostheses.

"Xx xx xx and do the prostheses are permanent living containing materials proposed for prostheses."
                                                                                                                                                                                                                                                                                                                                                            Polypeptide for constructing human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing, comprises three beta sheets and three beta turns.
                                                                                                                                                                                                                                                                     Rothstein S;

variants.

```
The present invention relates to the use of an agent that promotes elastin signaling in smooth muscle cells for decreasing or preventing occlusion of a body vessel by smooth muscle cells, decreasing vascular obstruction, promoting actin stress fiber formation or actin polymerisation, increasing F:G actin ratio in a smooth muscle cell, treating or preventing obstructive vascular disease (e.g. restenosis, or preventing stenosis. The agent that promotes elastin signaling in smooth muscle cells is useful for decreasing or preventing occlusion of a body
                                                                                          The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are useful to produce the proteins recombinantly. The tropoelastin derivatives have to produce the proteins recombinantly. The tropoelastin derivatives have the proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable &AG-binding properties, products. The hybrid protein have controllable &AG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents the amino acid sequence of the synthetic human tropoelastin SHEL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of an agent that promotes elastin signaling in smooth muscle cells for e.g. decreasing or preventing occlusion of a body vessel by smooth muscle cells, treating or preventing obstructive vascular disease, or
New derivatives of human tropoelastin - with elastin-like or
macromolecular binding properties, useful e.g. as surgical implants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; tropoelastin; elastin; body vessel occlusion; stenosis; vascular smooth muscle cell; elastin signaling; vasotropic.

The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of further comprises: a treatment of the gene signature. The invention further comprises: a treatment of rheumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and

efficacy of a candidate drug in vitro for the treatment of collagen-
induced arthritis; and reducing the symptoms associated with collagen-
induced arthritis: The compositions of the invention have the following
activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic,
antigout, antinflammatory, dermatological, and immunomodulatory. The
methods and compositions of the present invention are useful for
methods and compositions of the present invention are useful for
theumatoid arthritis, lupus, ankylosing spondylitis, fibrositis,
fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an
immune disease caused by an infectious agent. This sequence represents a
protein sequence relating to the genes used in the analysis and treatment
of autoimmune diseases or arthritides. Note: This sequence is not shown
in the specification. It has been supplied in an electronic format from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antiparkinsonian, antiasthmatic and synaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosals, hypertension, cancer, obesity, diabetes, Alba, multiple solerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as butilised to probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.

The present sequence represents a peptidomimetic of a cleavage site of a human tropoelastin. The specification describes human tropoelastin derivatives, in which a subsequence has been mutated so that cascaptability to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatived protease.

CC containing tropoelastin derivatives provide competitive proteining tropoelastin derivatived protease.

CC consection (e.g. antiwrinkle or hand locions), as bulking agents and for inducing chemotaxis. They are also useful for proliferation or growth commettics that mimic the protease cleavage site in tropoelastin epptidomimetics that mimic the protease cleavage site in tropoelastin contecting against lung damage caused by elastin, for inhibiting or containing localized growth of cancers or metastases, or to limit containing localized growth of cancers or metastases, or to limit
                                                                                                                                                                                                                                                                                   New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and

The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (6AG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical. pharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTB. The present sequence represents a human tropoelastin derivative SHEELdeltamodified New derivatives of human tropoelastin - with elastin-like or macromolecular binding properties, useful e.g. as surgical implants. Claim 7; Fig 3; 82pp; English. Sequence 660 AA;

New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and cell growth

Disclosure; Page 131-133; 136pp; English.

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is

increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatives competitive inhibition of protease activity. The tropoelastin derivative. Competitive inhibition of protease activity. The tropoelastin derivative competics (e.g. antiwarinkle or hand lotions), as bulking agents medicine, cosmetics (e.g. antiwarinkle or hand lotions), as bulking agents and for inducing chemotaxis. They are also useful for proliferation or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Competitive inhibitors of the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting %

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically dylvosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are useful to produce the proteins recombinantly. The tropoelastin derivatives pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents the synthetic human tropoelastin variant SHELGelta26A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              09

The present sequence represents a human reduced tropoelastin derivative, designated SHEL-delta-26a. The sequence is produced by removing exon 26a of SHEL (SHEL not defined). The protein is representative of tropoelastin derivatives of the invention, in which a subsequence has been mutated so that susceptibility to proteolysis is subsequence has been mutated so that susceptibility, to proteolysis is increased. The derivatives have with reduced susceptibility, and can be context with serum or wound exidate. The tropoelastin derivatives provide context with serum or wound exidate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative of derivatives, and other polypeptides containing tropoelastin derivative. Competitive inhibition, particularly sites, are useful in human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents of growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts, ottocase cleavage site in tropoelastin cendothelial cells, fibroblasts, ottocase cleavage site in tropoelastin protecting against lung damage caused by elastin, for inhibiting or protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting

In vitro diagnosis and monitoring of endometriosis, comprises detecting reduced expression of specific gene products, e.g. from the fibronectin

Claim 1; Page 15-16; 21pp; German.

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a control sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, albebyde dehydrogenase 6, gravin, phospholipase C epsilon, elastin, insulin-like growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor PTK7, collagen type XVIII alpha 1, platelet derived growth factor receptor alpha, laminin M chain, subtilisin like protein PACE4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human elastin

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      386
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            474

```
specification describes troposelastin derivatives, in which a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is reduced or proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease cropoelastin derivatived prived protease and other polypeptides containing tropoelastin derivatived protease-susceptibility sites, are useful in human or veterinary medicine, cosmetics (e.g. antiwrinke or hand or so bulking agents and for inducing chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth consecut for proliferation or growth inhibition, particularly of smooth consecut in tropoelastin derivatives are competitive inhibitors of characters and platelets. Peptidomimetics that mimic the protease consecution or growth inhibiting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or consecuting for inhibiting or controlling localized growth of cancers or consecuting passes beload clotting controlling localized growth of cancers or consecuting asses, or to limit protease activity that causes blood clotting
present sequence represents a human tropoelastin splice form. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         900
                                                                                                                  The present invention relates to a minimal functional unit (MFU) of human elastin polypeptide. This protein is useful in a cosmetic material or a prosthetic material such as prosthetis for blood vessel replacements, for heart valve replacement, tissue replacement, for covering burns, for covering wounds and stents
                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                    240
                                                                                                                                                                                                                                                                                                                                                                                                                                            240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                          9
                                            Novel polypeptides that comprise three beta-sheet/beta-turn structures and are not naturally occurring fibrous protein, used to produce prosthesis suitable for implantation into humans, and cosmetic materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  KYGAAVPGVLGGLGALGGVGI PGGVVGAGPAAAAAAAAAKAAAKAAQFGLVGAAGLGVG

Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-

      foods and industrial
wrinkle or hand lotions, also as surgical implants, foods and industrice products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTB. The present sequence represents the amino acid sequence of the synthetic human tropoelastin SHEL.

The agent that promotes elastin signaling in smooth muscle cells is useful for decreasing or preventing occlusion of a body vessel by smooth muscle cells, decreasing vascular obstruction, promoting actin ratio in a smooth muscle cell, treating or preventing obstructive vascular disease (e.g. restenosis following angioplasty), or preventing censoris. It is also useful in manufacturing a medicament for the treatment or prevention of occlusion of a vessel. The present sequence is the human tropoelastin protein as shown in the exemplification of the

Containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that can expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes for targeting in the treatment of the unatoid arthritis; identification of their than a mouse; diagnosis of rheumatoid arthritis; an amammal carry or gene chip, specific for rheumatoid arthritis; argument of collagencarry or gene chip, specific for rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collagency of a candidate drug in vitro for the treatment of collagency induced arthritis; and reducing the symptoms associated with collagency of a candidate drug in vitro for the invention have the following activities: immunosuppressive, antirheumatoid, antirheumatory, dermatological, and immunomodulatory. The mompositions of the present invention are useful for antigout, antiritis, lupus, ankylosing spondylitis, fibrositis, fibrositis, fibrosing and treating autoimmune disease or arthritides, such as the immuno disease caused by an infectious agent. This sequence is not shown in the specification. It has been supplied in an electronic format from when The method comprises obtaining a autoimmune disease or arthritides.

KYGAAVPGVLGGLGALGGVGIPGGVVGAGPAAAAAAAAAAAAAAAAAAAAAAGLGGLGVG 687 746 This invention describes a polypeptide that comprises three beta sheet/beta turn structures and that is not a naturally occurring fibrous protein. The invention also describes a prosthesis comprising an animal, metal or synthetic material, where the surface is coated with the polypeptide, a comprising the polypeptide, a high tensile strength material comprising the polypeptide, a high tensile strength material comprising the polypeptide, a high tensile strength material polypeptide comprising the polypeptide comprising the polypeptide comprising at least three beta sheet/beta turn spructures, (b) a polypeptide consisting essentially of a purton of the polypeptide consisting essentially of a portion of the amino acid sequence of an animal elastin comprising at least three beta sheets/beta turns, (c) a polypeptide consisting essentially of a portion Polypeptide for constructing human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing, comprises three beta sheets and three beta turns. GLGVPGVGGLGGIPPPAAAKAAKYGAAGLGGVLGGAGQFPLGGVAARPGFGLSPIFPGGA GLGVPGVGGLGGIPPAAAAKAAKYGAAGLGGVLGGAGQFPLGGVAARPGFGLSPIFPGGA fibrous protein; prosthesis; elastin; lamprin; spider silk protein; blood vessel; wound; burn healing; collagen. 190.

secondary structure comparison at manufacture.

secondary structure comparison at least three beta sheets/beta turns, where each of the beta sheet/beta turn structures comprises from 3 to about 7 amino acids and the polypeptide is not a maturally occurring fibrous protein. The minimal functional unit (WRU) of the invention is useful to construct human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing. Alternatively the MFU can be co-aggregated with other proteins, for example collagen, to provide prosthesis material that resembles the natural structural materials of the body. The MFU based material is subject to infiltration of cells growing in the patient, including endothelial cells, and the prosthesis can become a permanent living tissue, replacement. The material is more biocompatible than other elastin
                                   at
                             polypeptide consisting essentially of a spider silk protein comprising least three beta sheets/beta turns, a polypeptide having the primary structure of a portion of a naturally occurring fibrous protein and a
comprising at least three beta sheets/beta turns, and (d)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -containing materials proposed for prostheses.

The invention describes a polypeptide (I) comprising a minimal functioning unit (MFU) which is present in the sequence of human elastin cfunctioning unit (MFU) which is present in the sequence of human elastin least three beta-sheet/beta-turn structures, and at least one aminon acid residue that participates in cross-linking, and not construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel control of the conformation of the co immunogenic, thus providing a truly biocompatible material. MFUs modeled on lamprin and other fibrous proteins can be used to make a variety of materials having high tensile strength, elasticity and plasticity of their parent proteins. This is the amino acid sequence of mature human

This represents the human elastin sequence containing the minimal functional unit (MFU)-1 polypeptide of the invention. This MFU-1 is a polypeptide that has at least 1 seat 1 seat. Speta-structures, but is not a naturally occurring fibrous protein. Each beta-sheet structure has 3-7 (preferably 5-7) amino acids and the MFU polypeptide may include at can also be derived from the sequences of animal elastin, lamprin and spider silk protein. The MFU polypeptides are self-aligning peptides can also be derived from the sequences of animal elastin, lamprin and spider silk protein. The MFU polypeptides are self-aligning peptides comparing the same primary structure as part of a natural fibrous protein. They are used to coat prostheses made of animal or synthetic material or metal, particularly for use as blood vessel or heart valve replacements, coming the same primary structure. They can be used in cosmetic, elastic or high-tensile strength materials, e.g. ropes or parachute cord.

They are based on the MFU allow penetration of endothelial cells, so become permanent, living, tissue replacements. The MFU polypeptides have the elected blocompatibility than known elastin-based materials. They are well archive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           defined, homogeneous material and are easier to manipulate and produce than full-length elastins. They are non-thrombogenic and non-immunogenic. Materials can be made from 2 or more different MFU polypeptides to allow properties to be tailored for particular applications, e.g. combining the high extensibility of elastin and the high tensile strength of spider
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprocetrive, nootropic, antiparkinsonian, attiastimatic and synaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosolarosis, hypertension, cancer, obesity, diabetes, AIDS, multiple solerosis, preversus-host disease, Alzhaimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as butilised in gene therapy, chromosome mapping, tissue typing, hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             VPLGYPIKAPKLPGGYGLPYTTGKLPYGYGPGGVAGAAGKAGYPTGTGVGPQAAAAAK 235

Elastin based compositions useful for treating atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm, dissection SVAS and/or hypertension.

English 19pp; Example 3; Page 46;

The present sequence represents a human elastin. Peptides derived from

AAB08631 standard; peptide; 730 AA

AAB08631 ID AAB0 XX

elastin are used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprishing; inhibiting the proliferation of smooth muscle cells in vivo; snd regulating the differentiation of smooth muscle cells in vivo; and regulating the migration of smooth muscle cells in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized by diminished capacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vasculat bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy 120 146 180 240 366 300 09 326 360 386 420 446 474 506 534 999 594 626 654 98 27 GGVPGAIPGGVFGGVFYPGAGLGALGGGALGPGGKPLKPVPGGLAGAGLGAGLGAFPAVT 1 GGVPGAIPGGVPGGVFYPGAGLGALGAGGALGPGGKPLKPVPGGLAGAGLGAGLGAFPAVT 61 FPGALVPGGVADAAAAYKAAKAGAGLGGVPGVGGLGVSAGAVVPQPGAGVKPGKVPGVGL PIKAPKLPGGYGLPYTTGKLPYGYGPGGVAGAAGKAGYPTGTGVGPQAAAAAAAAKAAAKF 207 PIKABKLPGGYGLPYTTGKLPYGYGPGGVAGAAGKAGYPTGTGVGPQAAAAAAKAAAKF GAGAAGVI.PGVGGAGVPGVPGAI.PGI.GGI.AGVGTPAAAAAAAAAAAKAAKYGAAAGI.VPGG GAGAAGVLPGVGGAGVPGVPGAIPGIGGIAGVGTPAAAAAAAAAAAKAAKYGAAAGLVPGG 567 GLGVGAGVPGLGVGAGVPGRGAVPGALAAAKXGAAVPGVLGGLGALGGVGIPGGVVG 595 AGPAAAAAAAAAAAAQFGLVGAAGLGGLGVGGLGVPGVGGLGGIPPAAAAKAAKYGAA PGVYPGGVLPGARFPGVGVLPGVPTGAGVKPKAPGVGGAFAG1PGVGPFGGPQPGVPLGY PGFGPGVVGVPGAGVPGVGVPGAGIPVVPGAGIPGAAVPGVVSPEAAAKAAAKYGAR PGVGVGGVGGIPTYGVGAGGFPGFGVGVGGVGGVPGVGGVPGVGGVPGVGGVPGAAAA 387 PGVGVGGIPTYGVGGFPGFGVGGGFPGVAGVPGVGGVPGVGGVPGVGGVPGVGGSPEAQAAAA AKAAKYGVGTPAAAAKAAAKAAQF-----GLVPGVGVAPGVGVAPGVGVAPGVGLAPG VGVAPGVGVAPGVGVAPGIGPGGVAAAAKSAAKVAAKAQLRAAAGLGAGI PGLGVGVGVP GLGVGAGVPGLGVGAGVPGFGAVPGALAAAKAAKYGAAVPGVLGGLGALGGVGI PGGVVG Gaps 24; Length 712; Indels GLGGVLGGAGQFPLGGVAARPGFGLSPIFPGGACLGKACGRKRK Score 3485; DB 3; Pred. The protein is used in clastin and c-myc, preceded by a His tag. The protein is used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth muscle cell compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising: inhibiting the proliferation of smooth muscle cells in vivo; and regulating the migration of smooth muscle cell in vivo; and regulating the migration of smooth muscle cell in vivo; and regulating the compositions may be used for the prophylaxis or treatment of a disorder characterized by diminished capacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy

                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                 a
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidabelic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antiparkinsonian, antiasthmatic and preventing NOVA-associated disorders including cardiomyopathy, preventing NOVA-associated disorders including cardiomyopathy, sclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple atherosclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a derivative or variant of human tropoelastin (hTB) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              235
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      91
                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM0509-ADM06201 encoded by the polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AKAAKYGVGTPAAAAKAAAKAAAKAAQFGLVPGVGVAPGVGVAPGVGVAPGVGVAPG

```

The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein of the invention.

for tissues

New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tin which the corresponding protein is preferentially expressed.

Claim 20; SEQ ID NO 1593; 1177pp; English

```
The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tropoelastin; derivative; proteolysis; protease; antiwrinkle;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel collined is a polypeptide encoded by the polynucleotide or its partial peptide, immunologically assaying the polypeptide or peptide or its partial peptide, immunologically assaying the polypeptide or peptide or the polynucleotide, immunologically assaying the polypeptide or peptide or the polynucleotide by contexting the polypeptide or peptide or with the antibody of the encoded protein, and observing the binding conversable manner and an antisense polynucleotide. The oligonucleotide in an expressible manner and an antisense polynucleotide, or as a probect or susful as paramacutical agents and many disease-related proteins are useful as pharmacutical agents and many disease-related proteins of genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins, disease-related proteins and genes concoding them can be used as indicators for diseases (e.g. osteoporosis, encoding them can be used as indicators for diseases (e.g. osteoporosis, concorred presented is a protein of the invention. Note treat diseases. The common disease for the invention to treat diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            162

so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be contact the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative competitive inhibition of protease activity. The tropoelastin derivative derivatives, and other polypeptides containing tropoelastin derivative. The competition of protease susceptibility sites, are useful in human or veterinary and for inducing chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidominetics that mimic the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or protease activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated tropoelastin derivatives of the invention a subsequence has been mutated to that susceptibility to proteclysis is subsequence has been inserted so that susceptibility to proteclysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide contact with serum or wound exudate. The tropoelastin derivative protease-susceptibility sites, are useful in human or veterinary and for inducing chemotaxis. They are also useful for proliferation or and for inducing chemotaxis. They are also useful for proliferation or competition, particularly of smooth muscle cells, epithabial or growth inhibition, particularly of smooth muscle cells, epithabial or growth inhibition, particularly of smooth muscle cells, epithabial or endothelial cells, fibroblasts, osteoytes, chondrocytes and platelets. Ce protecting against lung damage caused by elastin, for inhibiting or protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit
                                  Tropoelastin, derivative, proteolysis, protease, antiwrinkle, hand lotion, bulking agent, chemotaxis, proliferation, growth inhibition, peptidomimetic, lung damage, elastin, cancer, metastasis, blood clotting.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a control of that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the activity as a compound to small molecule that regulates the solivity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating
                                                                                                                                 480

pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating plain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification, which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                               147
